HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

SERMENT D'HIPPOCRATE

« Au moment d'être admise à exercer la médecine, je promets et je jure d'être fidèle aux lois de l'honneur et de la probité.

Mon premier souci sera de rétablir, de préserver ou de promouvoir la santé dans tous ses éléments, physiques et mentaux, individuels et sociaux.

Je respecterai toutes les personnes, leur autonomie et leur volonté, sans aucune discrimination selon leur état ou leurs convictions. J'interviendrai pour les protéger si elles sont affaiblies, vulnérables ou menacées dans leur intégrité ou leur dignité. Même sous la contrainte, je ne ferai pas usage de mes connaissances contre les lois de l'humanité.

J'informerai les patients des décisions envisagées, de leurs raisons et de leurs conséquences. Je ne tromperai jamais leur confiance et n'exploiterai pas le pouvoir hérité des circonstances pour forcer les consciences.

Je donnerai mes soins à l'indigent et à quiconque me le demandera. Je ne me laisserai pas influencer par la soif du gain ou la recherche de la gloire. Admis dans l'intimité des personnes, je tairai les secrets qui me seront confiés. Reçu à l'intérieur des maisons, je respecterai les secrets des foyers et ma conduite ne servira pas à corrompre les mœurs.

Je ferai tout pour soulager les souffrances. Je ne prolongerai pas abusivement les agonies. Je ne provoquerai jamais la mort délibérément.

Je préserverai l'indépendance nécessaire à l'accomplissement de ma mission. Je n'entreprendrai rien qui dépasse mes compétences. Je les entretiendrai et les perfectionnerai pour assurer au mieux les services qui me seront demandés.

J'apporterai mon aide à mes consœurs et confrères ainsi qu'à leurs familles dans l'adversité. Que les hommes et mes confrères m'accordent leur estime si je suis fidèle à mes promesses ; que je sois déshonorée et méprisée si j'y manque.»

REMERCIEMENTS

Au Professeur Jean-Yves LE RESTE, Merci de me faire l'honneur de présider ce jury. Merci de la confiance que vous m'avez accordée tout au long de ce travail et de votre patience. Merci de votre implication totale auprès des étudiants en médecine générale brestois. Nous avons beaucoup de chance.

Au Professeur Benoît CHIRON, Merci d'avoir accepté de faire partie de ce jury, dans la droite ligne d'un travail que vous avez évalué précédemment. Soyez assuré de mon respect.

Au Dr Marie BARAIS, Merci pour vos enseignements et la façon dont vous nous amenez à nous remettre en questions dans nos pratiques. Je pense, entre autres, au séminaire « alliance thérapeutique », fondateur pour ma pratique. Merci d'avoir répondu présente pour l'évaluation de ce travail de thèse.

Au Dr Myriam BELHADJ, Merci beaucoup d'avoir accepté de faire partie de mon jury de thèse. La tienne a conduit à celle d'Elise, et celle d'Elise à la mienne. Cela a du sens pour moi que tu sois là pour évaluer ce travail.

Au Dr Catherine BOURILLET, Merci infiniment pour l'enseignement que tu m'as prodigué pendant les deux semestres passés à tes côtés. J'ai une immense admiration pour ta rigueur, ton choix de l'excellence et ton humanité. Puissé-je m'en inspirer tout au long de ma carrière. Merci pour ta confiance.

A M. Georges Beuzet, bibliothécaire de la faculté, qui avec patience et pédagogie m'a initiée à la recherche bibliographique.

A M. Antoine Dany, statisticien, maître de conférences, pour ses précieux conseils en matière de statistiques.

A Elise Payelle, Merci d'avoir pris le temps de me rassurer pour ma thèse alors que tu étais en plein bivouac avec Nils et les enfants ! Pour cette belle amitié, merci !

A tous mes maîtres qui en stage et en cours m'ont transmis leur savoir pendant 9 ans.

A mes collègues sage-femme de l'Institut Mutualiste Montsouris qui se sont mises en quatre pour mon planning lors de ma reprise d'étude. A Anne qui avait la première vu en moi une future généraliste. Pour tous ces moments forts au chevet des mères, la nuit le jour les weekends, à Noël...c'est indescriptible. Merci. A chaque insomnie je pense à vous : « il est 3h, il leur reste 5h avant la relève... ». Je ne vous oublierai jamais, vous avez ma plus totale admiration.

A mes parents pour leur soutien inconditionnel dans mes choix depuis toujours et leur confiance en mes capacités à faire face.

Merci papa et maman pour cet aller-retour Nantes Brest-Brest Nantes dans la même journée pour aller chercher un classeur oublié lors des révisions de 6^{ème} année... Cette anecdote en dit long sur votre implication pour nous.

Merci papa pour ce sens de l'effort et du travail bien fait que tu nous as inculqués depuis l'enfance, ton mépris absolu de la paresse et de la fainéantise. Si je parviens aujourd'hui au bout de ce double cursus, c'est en grande partie parce que je suis imprégnée de ces valeurs. Maman, merci pour ta douceur, ta confiance et ta patience, merci de n'avoir jamais douté que j'y parviens mais de t'être toujours inquiétée de ma fatigue !

A ma grand-mère, ma chère petite mamie, si infatigable et si dynamique ! Merci mamie d'être une si remarquable mamie, merci d'avoir fait brûler des kilos de cierges au pied de la Vierge Marie pour nous tes petits enfants, à chaque épreuve de nos vies et à chaque fois que nous prenons la route depuis chez toi ! J'ai à ce jour reçu 35 cartes d'anniversaire avec toujours une jolie citation et suis toujours repartie plus heureuse de chez toi. « Ne laissez personne venir à vous et repartir sans être meilleur et plus heureux »

A Frédéric, Laurence, Christophe et Béatrice, mes frères et sœurs, qui lorsque je me croyais folle de m'être mise dans une telle situation à mon âge changeait toujours la donne par leurs mots apaisants, rassurants et leur fierté d'avoir une sœur qui ne fait pas grand-chose comme les autres.

A mes amies du vignoble, mes amies du lycée, mes amis de médecine à Nantes et à Paris, mes amies de l'école de sage-femme, mes amis de Brest... Quel bonheur de vous avoir ! Merci à mes chères amies d'enfance qui ont fait la route de loin pour venir aujourd'hui. Merci à Ophélie de venir sur un repos de garde !

A mes filleuls Pauline, Augustine, Zélie, Antonin, Thaïs et Henri.

A ma belle-mère, Anne, qui cet été m'a permis de vraiment faire le virage nécessaire pour finir ce travail... Merci pour votre confiance et votre optimisme.

A Amaury pour avoir pris de son précieux temps pour la mise en page. Je ne sais comment j'aurais fait sans toi. Pour cela merci. Pour notre amitié, pour notre aventure de vie commune sur le chemin de l'adoption, merci.

A Paul, mon mari, tu avais dit de moi « l'audace et la ténacité » et j'avais dit de toi « la bienveillance et la bonté ». Je n'ai pas changé d'avis depuis ce temps-là. J'ajouterais simplement la loyauté et la détermination. Je suis si heureuse d'être dans le même train que toi pour la vie, je n'en reviens toujours pas de ma chance...

A nos enfants, vous êtes dans notre cœur je crois depuis toujours. Chaque jour nous rapproche des retrouvailles. Chers enfants, un papa et une maman vous aiment et vous attendent de l'autre côté de l'océan.

ABSTRACT

Background: Pain is a multidimensional phenomenon that is subjective with physiological and psychological components. It is necessary to have valid and reliable pain measures. A previous study has identified Brief Pain Inventory (BPI), SF MPQ-1 and 2 (Short Form McGill Pain Questionnaire) as reliable. Visual Analog Pain Scale (VAS) and Pain drawing were less reliable but they are commonly used. The present study aimed to collect validity data of these four scales.

Method: A Medline review via PubMed was carried out with no restriction on the publication date. Only English language papers were examined. Inclusion was conducted until June 2019. Data of validity (convergent, discriminant, construct, face and responsiveness) were extracted for each four scales.

Results: 17 relevant articles were included for BPI, 8 for SF-MPQ-1, 5 for SF-MPQ-2, none for Pain drawing and 2 for VAS. Convergent validity was studied in several articles included for each scale. Construct validity was studied only for BPI and SF-MPQ. Discriminant validity was studied only for BPI in one article. Face validity was studied in one article for both SF-MPQ-1 and 2. Responsiveness was studied in one article for BPI, 2 articles for SF-MPQ-1 and 3 articles for SF-MPQ-2.

Satisfactory validity data were found for BPI and SF-MPQ. Data were inadequate for Pain drawing and insufficient for VAS.

Discussion: The five relevant validities were not all studied for BPI and SF-MPQ. Further studies could supplement these data. It will be necessary to study external validity of VAS, which is very useful in practice.

RESUME

Introduction: La douleur est un phénomène multidimensionnel de nature subjective avec des composantes physiologiques et psychologiques. Il apparaît utile d'avoir des outils valides et fiables pour l'évaluer. Une étude précédente a identifié le Brief Pain Inventory (BPI) et la Short Form du McGill Pain Questionnaire version 1 et 2 (SF MPQ 1 et 2) comme fiables. L'échelle visuelle analogique (EVA) et le Pain drawing étaient moins fiables mais sont couramment utilisées. La présente étude visait à recueillir les données de validité de ces quatre échelles.

Méthode: Une revue de Medline via PubMed a été réalisée sans restriction de date de publication. Seuls les articles de langue anglaise ont été examinés. L'inclusion a été effectuée jusqu'en juin 2019. Les données de validité (convergente, discriminante, de construit, apparente et sensibilité au changement) ont été extraites pour chacune des quatre échelles.

Résultats: 17 articles pertinents ont été inclus pour BPI, 8 pour SF-MPQ-1, 5 pour SF-MPQ-2, aucun pour le Pain drawing et 2 pour l'EVA. La validité convergente est toujours étudiée. La validité de construction est étudiée seulement pour BPI et SF-MPQ. La validité discriminante n'est étudiée que pour BPI et dans un seul article. La validité apparente n'est étudiée que dans un article pour SF-MPQ 1 et 2. La sensibilité au changement est étudiée dans un article pour BPI, dans 2 articles pour SF-MPQ-1 et dans 3 articles pour SF-MPQ-2. Des données de validité satisfaisantes ont été trouvées pour BPI et SF-MPQ. Les données de validité collectées étaient inadaptées pour le Pain drawing et insuffisantes pour l'EVA.

Discussion : Les cinq validités pertinentes n'ont pas toutes été étudiées pour BPI et SF-MPQ. Des études complémentaires pourraient enrichir ces données. Il sera nécessaire d'étudier les propriétés psychométriques de l'EVA, très utilisée dans la pratique.

1 INTRODUCTION

Pain is a multidimensional phenomenon that is subjective in nature with physiological and psychological components (1). The pain sensation may be hard to explain verbally. The patient self-reports seem to be a reliable indicator of the existence and intensity of pain.

Multidimensional scales make it possible to specify the semiology of pain and to take into account all of its sensory and emotional components but are longer to fill and to score.

Uni-dimensional scales are easy to operate but only the intensity of pain is assessed.

Previous study made an inventory of pain scales to assess pain in the general population. Among the 35 scales available, the most studied scales were the Numerical Pain Rating Scale (NPRS), the Visual Analog Scale (VAS), the Brief Pain Inventory (BPI) the McGill Pain Questionnaire, and its Short Form (SF-MPQ), the West Haven Yale Multidimensional Pain Inventory (WHYMPI) (2).

To be effective, a scale must be reliable and valid. A measuring instrument is reliable if it produces the same score during measurement made at different times by the same examiner and in measurement made at the same time by different examiners (3).

A systematic review collected validity in terms of reliability data of available pain assessment scales in general population. That study highlighted three reliable scales: BPI, SF-MPQ-1 and SF- MPQ-2 (4).

Nevertheless, validity of a scale is also its ability to measure what it is supposed to measure (external validity). This is also a most important metrological quality.

The external validity data of these three reliable scales, BPI, SFMPQ-1 and 2 were studied here. Although Pain drawing and Visual Analog Pain Scale were reliable only on ICC (Intra-class Coefficient Correlation), these two scales have also been added in this systematic review because they are commonly used in practice.

The four scales are to be found in Appendix 1.

- **BPI:**

Two versions of BPI exist: BPI Long Form is used as a baseline measure in clinical trials but the Short Form has become the standard for use in clinical and research applications. Only BPI-Short Form is described below.

The BPI assesses pain severity, pain interference and pain locations using a body diagram. Pain severity is assessed by four items that ask about pain now, worst pain, least pain and average pain. Items use numeric rating scales anchored by a 0 (no pain) to 10 (most severe pain). Pain interference consists of seven items that ask about how pain interferes with aspects of daily living using numeric rating scales anchored by 0 (no interference) to 10 (completely interferes). On the body diagram, patients indicate the location of pain. An item asks to record pain medication and to circle the percentage that most shows how much relief has been received.

- **SF-MPQ:**

The SF-MPQ was developed by Melzack as an abbreviated modification of the original (5).

The SF-MPQ-1 (6) has 15 representative words, 11 sensory (throbbing, shooting, stabbing, sharp, cramping, gnawing, hot-burning, aching, heavy, tender, and splitting) and 4 affective (tiring-exhausting, sickening, fearful, punishing-cruel) words. Each word is scored from 0 to 3 (not selected = 0, mild =1, moderate =2, severe = 3). The scores on the words are added up for the sensory (0 to 33) and affective (0 to 12) subscales as well as the total scale (0 to 45). The SF-MPQ-1 included a 10 cm horizontal VAS for pain with endpoint « no pain » and « worst possible pain » and six words describing Present Pain Intensity (PPI) :

none, mild, discomforting, distressing, horrible, and excruciating corresponding to a 0 to 5 numeric scale.

The SF-MPQ-2 was developed in order to be more sensible to neuropathic pain. The SF-MPQ-2 is self-rated by subjects according to the intensity of pain perceived on a 0-10 numeric scale (0= no pain and 10= the worst pain). It is composed of 22 pain descriptors and distributed as 4 subscales. It include six continuous pain descriptors (throbbing, cramping, gnawing, aching, heavy pain, and tender), six intermittent pain descriptors (shooting, stabbing, sharp, splitting, electric-shock pain, and piercing), six predominantly non neuropathic pain descriptors (hot burning and cold freezing pain, pain caused by light touch, itching, tingling or pins and needles, and numbness), and four affective descriptors (tiring-exhausting, sickening, fearful, and punishing-cruel) The four subscales scores is calculated by summing the numerical value for all 22 items. The total score is the sum of all the values.

- **Pain drawing:**

There were two main methods of analyzing a pain drawing: qualitative and quantitative (7) (8).

The qualitative analysis looked for dermatome distribution of pain. Based on either penalty point system or on a general impression Pain drawing was characterized as « organic » and « non-organic » (9). The Ransford Penalty Point method gave a semi quantitative interpretation. The four criteria of this method were: the reasonableness of the anatomic distribution, information signaling “Look how bad I am”, whether they reflect “magnification” of pain, the presence of indicators that “I particularly hurt here».

A score of fewer than 3 points was classified as “normal” (=organic) whereas 3 or more points was “abnormal” (=non organic) (10). Other sources classified as normal a score of 2 or

less and abnormal a score greater than 2 (11). Different symbols were used on the body to indicate aching, burning, pins and needles, numbness and stabbing.

The quantitative analysis recorded the proportion of the body surface covered by pain equivalent markings. It gave an estimation of widespread versus localized pain and of the location of pain. The body surface was divided into 45 parts (12), or into a grid system with 256 equal squares (Gatchel and coworkers (13)) or other systems. For each of the areas, a score of 1 was given if the patient's shadings indicated that pain was present, and a score of 0 was given if pain shadings were absent. The scale is actually subject to many controversies.

- **VAS:**

The Visual Analogue Scale (VAS) is commonly used as the outcome measure for such studies. It is a uni-dimensional scale that varies only in intensity (14). It is usually presented as a 100-mm horizontal line on which the patient's pain intensity is represented by a point between the extremes of "no pain at all" and "worst pain imaginable", or "least possible pain" and "worst possible pain" (15). The VAS is scored from 0 (no pain) to 10 (pain as bad as it could be)." It has the advantages of being easily administered and requires no verbal or reading skills (15).

The aim of this study was to investigate the external validity of Brief Pain Inventory, Short-Form McGill Pain Questionnaire 1 and 2, Pain drawing, Visual Analog Pain Scale .

2 METHOD

2.1 General framework of the study

The first part of the research consisted of a systematic review of literature of the four selected pain assessment scales: Brief Pain Inventory, Short Form McGill Pain Questionnaire 1 and 2, Visual Analog Pain Scale and Pain drawing

As proved by the previous work (4), these four scales are reliable, but only on ICC for Pain drawing and Visual Analog Pain Scale. These two scales are commonly used in current practice, so it was decided to study their own validity too.

This study aimed to collect external validity data of these four scales. It was necessary to identify the most relevant types of validity. For each scale, it was checked whether the selected validities were studies

2.2 External validity data

External validity regarding pain could be difficult to assess as it was written in the introduction. The following criteria were selected with the help of the statisticians from research unit SPURBO.

2.2.1 Convergent validity

This validity is the validity against criterion. The scale is compared with another scale as a gold standard. A correlation between the two tools is sought. Pearson coefficient (for linear correlation) and Spearman coefficient (for rank correlation) are used to measure this validity. A scale is a longitudinal variable, so the convergent validity is the equivalence of the contingency table for categorical variables. This validity is more accurate than concurrent validity. It is very close to criterion validity.

2.2.2 Discriminant validity

It is the ability of the scale to give a different measurement in “a priori” different groups. It is a hypothetical-deductive reasoning: hypotheses (theory) are put to the test of the data (the reality). This validity is intended to measure if what is expected is what it is measured. It is a cross-sectional inquiry. For example, two groups of patients with two different types of pain fill the same scale and are compared. The Fisher, Chi², Wilcoxon are tools used for statistics on this validity.

2.2.3 Content and construct validity

It is when the scale is built. Content validity is the qualifier of the expert clinicians. The experts confront their theoretical model with the data. This is achieved by the appropriate selection of test items when the measure is developed. Construct validity is when the statistics confirm these data and refers to the extent to which scores on the test behave as one would theoretically expect them to behave. This validity is very close to reliability. It is measured by the Confirmatory Factor Analysis (CFA) (16). The higher the variance, the stronger the scale structure is. The CFA is a hypothesis-driven technique that is used for testing the proposed factor structure of a given scale. It differs from the Exploratory Factor Analysis (EFA) in that it can confirm the validity of factor structure determined a priori rather than seeking a new factor structure (17), The Principal Component Analysis (PCA) is also used, it is a variant of the CFA.

Construct validity can also measure correlation between the subscales in a multidimensional scale.

2.2.4 Face validity

This validity measures how the questions are perceived by the patient. This is in order to see if the questions seem coherent to him.

2.2.5 Responsiveness to treatment and sensitivity to change

A critical psychometric property of pain scale is its ability to detect change. Responsiveness requires treatment to be evaluated whereas sensitivity to change does not require a treatment to be present. These two concepts are sometimes used synonymously. It is the ability of the scale to measure change in pain. These psychometric properties are evaluated by prospective studies and require a huge investment. It is a longitudinal validity. This is the culmination of the construction of a scale. It is rarely done because it is difficult to implement and expensive.

2.3 Information sources

Studies were identified through a search on Medline via PubMed. The search was limited to research studies in humans published in English with no restriction on the publication date of retrieved papers. The systematic review was conducted between September 2018 and June 2019.

Secondly, the bibliography of all the included studies about the validity of these four scales was read in order to include additional articles and to be as exhaustive as possible.

All the articles found by the search equation were included on an excel file (Appendix 7). Abstracts were fully read. It was decided whether or not to include the full corresponding article. The file provided tabs, there was one tab per scale. In these tabs, each article was linked to a number to make it easily identifiable. Another Excel file was edited to distribute validity data by scale and by article (Appendix 4).

2.4 Search

The first step was to build basic equations about the validity of the four scales. The librarian of Brest medical library was asked to help building these equations. All equations are to be found in Appendix 2.

For Medline research, equations combined MeSH words such as “Reproducibility of results”, “psychometrics” and “sensitivity and specificity”.

In order to have the most accurate selection, because the MeSH terms are not all indexed, text and abstract keywords related to validity without MeSH terms were added: “validity and reliability”, “validity”, “sensitivity and specificity”, “psychometric properties”.

For each scale, the name of each scale was added to each equation: [(Name of the scale) AND (equation with MeSH term) OR (Name of the scale) AND (others terms without MeSH)]. For SF-MPQ, it was necessary to write “SF-MPQ-1 OR SF-MPQ-2”.

For Visual Analog Pain Scale, another equation was created: ((visual analog scale [Title] AND pain[Title/Abstract]) AND validity[Title/Abstract]). It was finally necessary to single out the word “pain” in order to find articles of interest.

2.5 Study selection

For all the articles found by a search equation, the following data were collected: title, author, year of publication, review, language, abstract or not. For each article, title and abstract were screened to determine if the article was relevant to answer the research question. When the abstract was doubtful, the article was included and fully read.

The first step was to determine if the article was off-topic. Four off-topic classes were determined:

- no validity data
- lack of quality (no abstract, article not in English, no IMRAD format, translation of the original article not accessible on PubMed)
- no dealing with humans
- scale used in another field than pain.

Duplicates were noted too.

The next step was to determine exclusion criteria. Five exclusion criteria were:

- specific population (selected according to their age: old people, children)
- convergent validity assessed with an unreliable scale
- only a subset of the scale being analyzed (for multidimensional scale)
- scaling modification but unverified validation procedure of the original
- only anatomo-clinical correlation being analyzed

When the convergent validity was assessed with several scales, the article was included and only the analyses with reliable scales were extracted.

2.6 Data collection process

All the articles likely to be included were fully read. For all the articles included, the following parameters were extracted: language version of the scale, the type of pain assessed, convergent validity, discriminant validity, construct validity, face validity and responsiveness. Some articles could be discarded after full reading if off-topic or exclusion criteria were identified at this stage of the study.

Comparison of pain measures in surgical patients	Zalon ML	June -05	Journal of Nursing Measurement

Table 1: Included articles for BPI

3.1.3 Summary of the results

Detailed table of are to be found in Appendix 4.

Validity of BPI that was the most analyzed was construct validity by the Confirmatory Factor Analysis (CFA).

14 articles on the 17 included referred to the CFA. Two or three factor solutions were found. 8 articles showed a two-factor solution and 5 articles showed a three-factor solution. 1 article, which especially studied the CFA, showed that the three-factor solution is best for the BPI'S construct validity (18). 1 article analyzed the construct validity using intensity and interference and studying their own correlation (19).

8 articles included referred to BPI's convergent validity. 1 article used SF-MPQ as the gold standard (20) and 5 articles used VAS (16), (21), (22), (23), (24). 1 used both VAS and SF-MPQ (1). 1 article studied the aptitude of BPI to discriminate neuropathic and nociceptive pain by calculating sensitivity and specificity in neuropathic pain (25).

Only 1 article analyzed the responsiveness of BPI at three month (21).

Most of the time, discriminant validity was not analyzed as expected with the statistician, (20), (21), (26), (27). There was an amalgam with convergent validity or construct validity. Only one article analyzed discriminant validity as expected (25). Face validity was not analyzed in the articles included.

From this study, validity of BPI has been studied in these fields:

-Original version of BPI:

neuropathic and nociceptive pain (25), chronic obstructive pulmonary disease (20), in patients with osteoarthritis (23) , on surgical patients with cancer (24), in patients with bones metastases (26), in surgical patients (1).

-Modified version of BPI:

modified version on painful peripheral neuropathy in diabetic patients (27) and in patients with facial pain (28).

-Translated version of BPI:

on Turkish patients with musculoskeletal pain (16), on Spanish patients with non-cancer related pain (21), on Lebanese patients with cancer pain (22), on Turkish version in surgery (29), on Thai version in cancer patients (30), on North India patients with cancer pain (31), on Japanese patients with cancer pain (32).

3.2 Short Form McGill Pain Questionnaire

Table 2: Included articles for SF-MPQ.

3.2.3 Summary of the results

Detailed table of results are to be found in Appendix 5.

The validity of SF-MPQ that was the most analyzed was construct validity by the Confirmatory Factor Analysis (CFA), the Exploratory Factor Analysis (EFA), the Principal Component Analysis (PCA) and content validity by the “33% Melzak criteria” (when creating the scale, Melzak chose adjectives which were approved by 33% or more patients who had very variable pain).

3.2.3.1 SF-MPQ-1

For SF-MPQ-1 (8 articles included), 6 articles were studying construct validity. Among these 6 articles, 3 articles analyzed construct validity by the CFA, the EFA, and the PCA, (33), (34), (35). 3 articles analyzed content validity by the “33% Melzak criteria” (35), (36), (37). So, one article analyzed both construct and content validity (35). 4 articles studied correlation within the scale, using the different items as comparators themselves: VAS and PPI (Present Pain Intensity) versus items about pain (35), (36), (37), (38).

2 articles referred to convergent validity, 1 article used BPI as gold standard (38) and 1 article used VAS as gold standard (39). 1 article assessed face validity (38). 2 articles assessed responsiveness (33),(40). 1 article analyzed responsiveness but the results were not significant (35). No article assessed discriminant validity.

One article studied only the factorial validity of the SF-MPQ-1 in order to know which one is the best between a two factor and a three factor solution (34). The authors concluded that a two dimensional structure is better.

From this study, validity of SF-MPQ-1 has been studied in these fields:

-Original version of SF-MPQ-1:

In women with chronic pelvic pain (39), SFMPQ-1 has a good convergent validity with VAS but cannot be used as a diagnostic test.

-Translated version of SF-MPQ-1:

Validity of the scale has been evaluated in Arabic version in chronic pain (38), in Iranian version in chronic pain in rehabilitation clinic (33), in Thai version in musculoskeletal pain and neuropathic pain (36), in Greek version in spinal and osteoarthritis chronic pain (39), (40) and in Swedish version in rheumatoid arthritis or fibromyalgia syndrome (35).

3.2.3.2 SF-MPQ-2

For SF-MPQ-2 (5 articles included), all the articles referred to construct validity by the CFA and the EFA (17), (41), (42), (43), (44).

4 articles analyzed convergent validity. Among these four articles, 1 article used VAS and SF-MPQ-1 as gold standard (17), 1 article used SF-MPQ-1 (its VAS and PPI) (42), and 2 articles used BPI as gold standard (43), (44).

One article assessed face validity (42). 3 articles assessed responsiveness (42) (43), (44). No article referred to discriminant validity.

From this study, validity of SF-MPQ-2 has been studied in these fields:

- Original version of SF-MPQ-2:

In acute low back pain, SF-MPQ-2 showed convergent validity, construct validity and responsiveness (44).

- Translated version of SF-MPQ-2:

Validity of the scale was evaluated in Chinese patients with visceral pain for more than three weeks (41), in Japanese patients with neuropathic and non- neuropathic pain (17), in Iranian patients with subacute and chronic non neuropathic pain and patients with painful diabetic peripheral neuropathy (42).

3.3 Pain drawing

3.3.1 Flow chart

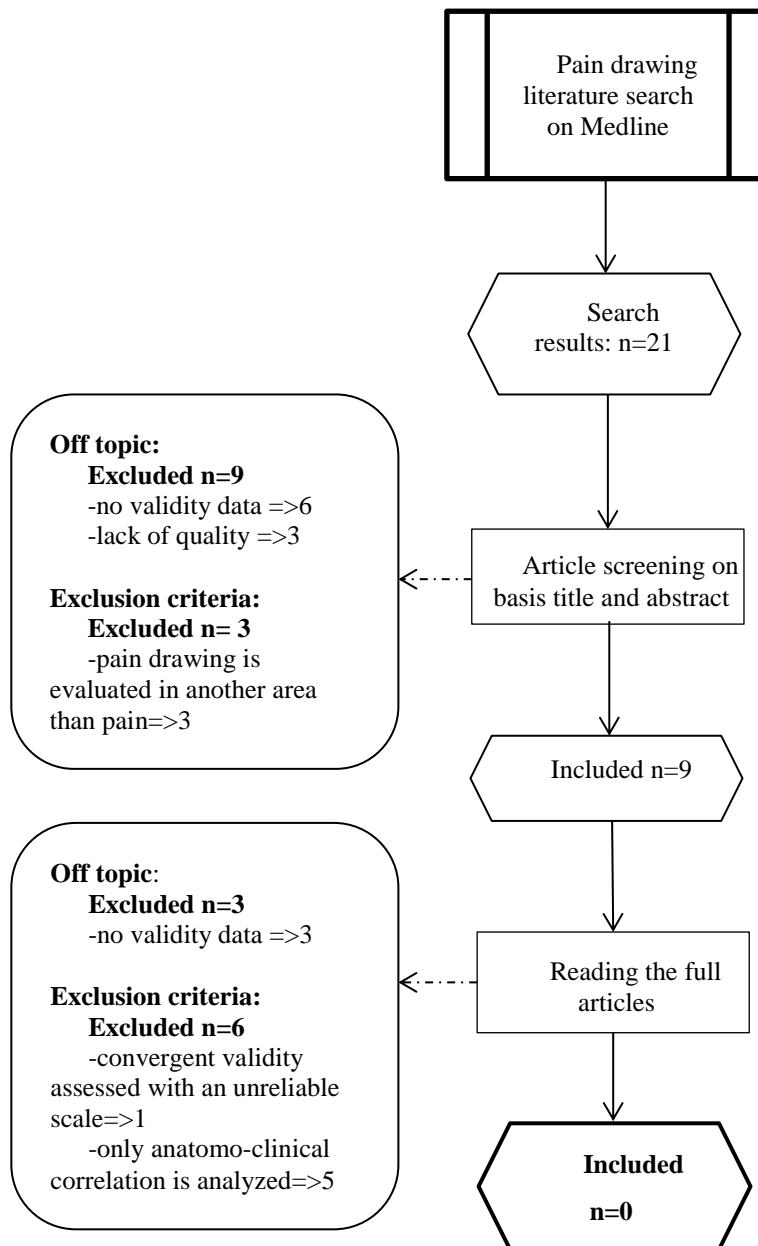

Figure 3: Flow chart Pain drawing

3.3.2 Summary of the results

9 articles have been fully read. 5 articles assessed convergent validity of Pain drawing but in order to know predictive anatomo-clinical value of this scale. The question of whether to include these articles or not was raised. Convergent validity was assessed with clinical examination or radiological examination. This convergent validity did not given information on the assessment of the intensity or interference of pain but on its localization. It was eventually decided to exclude these 5 articles (45), (46), (47), (48), (49).

Several studies have actually examined the use of pain drawings as predictors of psychological involvement in pain.

The validity of Pain drawing was therefore not analyzed for pain assessment in itself.

3.4 Visual Analog Pain Scale

3.4.1 Flow chart

Figure 4: Flow chart VAS

3.4.2 Included articles

Title	Author	Year	Revue
Correlation of change in visual analog scale with pain relief in the ED.	Fosnocht DE1, Chapman CR, Swanson ER, Donaldson GW.	January 2005	The American Journal of Emergency Medicine
Reliability and validity of a visual analog scale for acute abdominal pain in the ED.	Gallagher EJ1, Bijur PE, Latimer C, Silver W.	July 2002	The American Journal of Emergency Medicine

Table 3: Included articles for VAS

3.4.3 Summary of the results

Detailed table of results are to be found in Appendix 6.

Only 2 articles have been included. Convergent validity was assessed with Verbal Descriptors Scale (VDS) in these two studies. At the time of each repeated pain VAS measurement, patient indicated whether their pain was “much less, a little less, about the same, a little more, or much more” than at the time of their last pain measurement. The correlation between the change in VAS scores and the verbal was calculated.

The first article (50) studied patients with painful injury or illness in the ED (Emergency Department). Patients receiving pain medication provided a second VAS 30mn after medication, and all patients filled VAS at the time of discharge. The article showed that change on VAS was moderately correlated with a VDS of change in pain in the ED. Change in pain was not a valid indicator of pain relief for individual patients.

The second article (15) studied population in the ED with acute abdominal pain. Mean and median VAS scores increased in a linear and graduated fashion as the description of change in pain escalated from “much less pain” to “much more pain”. VAS seemed to be a valid instrument for measuring acute abdominal pain in the ED. Unfortunately, reliability was studied only on ICC.

No modified version and no translated version of VAS have been found in this study.

4 DISCUSSION

4.1 Synthesis of the results

Table 4: summary of the results.

	Convergent validity	Discriminant validity	Construct validity	Face validity	Responsiveness
BPI. 17 articles included.	8 articles	1 article	14 articles	0	1 article
SF-MPQ-1 and SF-MPQ-2. 13 articles included.	6 articles 2 for SFMPQ1 4 for SFMPQ2	0	11 articles 6 for SFMP1 5 for SFMPQ2	2 articles 1 for SFMPQ1 1 for SFMPQ2	5 articles 2 for SFMPQ1 3 for SFMPQ2
Pain drawing. 0 article included.	5 articles (excluded/ anatomical clinical correlation)	0	0	0	0
Visual Analog Pain Scale. 2 articles included.	2 articles	0	0	0	0

Abbreviations : *BPI* : *Brief Pain Inventory*, *SF-MPQ* : *Short Form McGill Pain Questionnaire*.

These results indicated that BPI was the most studied scale, then SF-MPQ, then Pain drawing and finally VAS.

For BPI and SF-MPQ, the most studied validity was the construct validity with 14 articles for BPI and 11 articles for SF-MPQ.

Convergent validity was also commonly studied with 8 articles for BPI and 6 articles for SF-MPQ. Face validity was only studied for SF-MPQ, and only in 1 article for SF-MPQ-1 and 1 article for SF-MPQ-2. Discriminant validity was most of the time not studied as expected, and an amalgam was observed with construct and convergent validity. Only one

article, for BPI, studied discriminant validity. Responsiveness, as expected, was poorly studied: 1 article for BPI and 5 articles for SF-MPQ were found.

For VAS and Pain drawing, convergent validity only was studied.

Validity of VAS was hardly studied. Only 2 articles were included and one of them concluded that this scale was not valid to evaluate pain relief for individual patients in emergency. VAS seemed to be valid only in abdominal acute pain to emergency department. Unfortunately, it was not reliable enough in this article, because only the ICC (Intraclass Coefficient Correlation) was analyzed. Moreover, for VAS, convergent validity was assessed with verbal pain descriptors as gold standard. No relevant data were found on literature about such a comparator.

For Pain drawing, 5 articles were found for convergent validity. This work highlighted that validity of this scale was well studied according to our criteria but only in order to do anatomo-clinical correlation. They were excluded.

Finally, satisfactory psychometric data were found in several studies for BPI and SF-MPQ. Validity of SF-MPQ was studied in four on the five validities chosen and was evaluated in responsiveness, so SF-MPQ seemed to be the most valid scale.

These results were congruent with the two previous studies (2), (4). In the study listing the different scales of pain, scales more studied and used as gold standard were NPRS, VAS, BPI, MPQ, SF-MPQ and WHYMPI. In the study listing their reliability, only BPI and SF-MPQ showed enough reliability data to be considered reliable.

To be congruent with the two previous works, the present study excluded several articles for convergent validity when the gold standard was an unreliable scale like NPRS (Numerical Pain Rating Scale) and NRS (Numerical Rating Scale) or SF-36 BPS (Short Form-36 Bodily Pain Subscale). In the previous study (4), VAS was not considered reliable because only ICC

value was found, as for Pain drawing. This current study confirmed that these two scales were insufficiently studied. About reliability, data about Cronbach's alpha for internal consistency and Cohen's kappa for inter-rater reliability should be studied. About validity, all validities will have to be assessed by next studies.

Despite this result, VAS seemed to be very convenient and easy to use in practice. Pain drawing made it possible to evaluate by various means the surface felt as painful by the patient. These two scales should be more studied.

As the previous work (4), BPI and SF-MPQ-1 and 2 showed the best psychometric qualities. SF-MPQ showed better validity than BPI because it was evaluated in more fields. These two scales could be considered reliable and valid.

For uni-dimensional scales, these three successive studies ((2), (4) and this one) raised the same limit: none can be assimilated as gold standard.

Very few similar studies were found on PubMed. Only one systematic review was found for BPI (51) and two for Pain drawing (52), (53). Unfortunately, for BPI the article was in German. For Pain drawing, the two articles referred to identifying psychological distress and doing psychological screening, so it was not to evaluate pain in itself.

To our knowledge, that work in three stages is led for the first time. To my mind, the BPI is the most complete scale to assess pain in all its dimensions: intensity, interference with daily life, treatment's efficiency, pain localization. In general medicine, we must take into account the patient in his life context. BPI seems to me to meet this requirement. If I could not understand the patient's description of pain, I would choose SF-MPQ: its sensorial and affective terms are varied and precise. For neuropathic pain, SF-MPQ-2 and its 22 items can be very helpful. VAS seems to me relevant for acute pain in emergencies.

4.2 Limitations

Five main biases have been identified in the current study:

- during the development of the search equation
- single screening investigator to do inclusion
- inclusion of English articles only
- exclusion of some specific populations
- only one database.

For search equation, the build of one equation per scale was not done first. Hypothesis of relevant terms about validity and search them into the MeSH was done. Unfortunately, “validity” alone, “validity and reliability” were not indexed. Arbitrary choice of terms in the equation was done. Four equations per scale were used at the beginning (Appendix 2). While reading articles, relevant validity were spotted but the inclusion had already begun. Terms that seemed to be more precise were not added in our equation so as not to restrict the search. Indeed, few articles were found. For VAS, it was finally necessary to separate the word “pain” from the name of the scale. It was not intuitive because VAS is used in many other fields than pain. To reduce this bias, the design of search equation was discussed with the librarian.

An interpretation bias can be identified because only one investigator proceeded to the inclusion. To reduce this bias, exclusion criteria and articles bringing back questions were discussed in research group. Nevertheless, some articles may have been forgotten or wrongly excluded.

A selection bias can be identified because only articles in English were included and several articles were excluded for BPI, SF-MPQ and Pain drawing. For example, one article for Pain drawing was excluded because in German but it seems to be interesting from the title (54).

Another selection bias can be discussed: all articles about older people or children were excluded in order to study, as much as possible, general population. These two populations are those for which the evaluation of the pain is the most difficult: psychometric properties of the pain scales have to be studied in those particular contexts.

Another limit is that only one database was screened. Results obtained cannot be exhaustive. Nevertheless, Medline via PubMed is widely used in medical and scientific community.

5 CONCLUSION

BPI and SF-MPQ-1 and 2 are both multidimensional scales and they have been more studied than uni-dimensional scale. They seemed to be efficient. They have been tested in various languages and for different types of pains.

Multidimensional scales assess not only the intensity of the pain but also its interference with daily life. They allow a more precise description of the pain. Filling the questionnaire of BPI and SF-MPQ is fast enough and give valuable information about the feeling of pain.

Next studies should explore responsiveness of BPI and SF-MPQ 1 and 2, indeed it is the strongest validity. Very few articles were found for face validity, it seemed unfortunate that it was not a priority. It might be interesting to consult patient's opinion for each scale. Discriminant validity would give information of the same scale in different populations during the same study.

VAS and Pain drawing did not showed efficiency data. VAS was insufficiently studied, it could not be considered enough valid. In practice, using VAS is extremely common especially to emergencies. Its validity and reliability should be studied first. Pain drawing's interpretation remains complex and seems to be not consensual. Its validity is only studied for anatomo-clinical correlation. Pain drawing seems to be very interesting for radicular and neuropathic pain. It is actually studied more and more.

International Association for the Study of Pain defines pain as: "Pain is a sensory and uncomfortable experience, associated with or described in actual or potential tissue injury".

Pain is significantly studied and the means to relieve it are more and more effective. Field of research is huge. Nevertheless, very few pain scales are relevant in their psychometrics properties. It will be interesting to monitor new studies about uni-dimensional pain scale in

order to have gold standard, and to complete study of validity for multidimensional scales to be more efficient.

ABBREVIATIONS LIST

BPI: Brief Pain Inventory

CFA: Confirmatory Factor Analysis

ED: Emergency Department

EFA: Exploratory Factor Analysis

EVA: Echelle Visuelle Analogique

ICC: Intraclass Coefficient Correlation

MeSH: Medical Subject Headings

NPRS: Numerical Pain Rating Scale

PCA: Principal Component Analysis

PPI: Present Pain Intensity

SF-MPQ: Short Form McGill Pain Questionnaire

SF-MPQ-2: Short Form McGill Pain Questionnaire 2

SF-36 BPS: Short Form-36 Bodily Pain Subscale

SPURBO: Soins primaires, Santé publique, Registre des cancers de Bretagne Occidentale.

VAS: Visual Analog pain Scale

VDS: Verbal Descriptors Scales

WHYMPI : West Haven Yale Multidimensional Pain Inventory

APPENDIX 1: THE FOUR SCALES

BPI SHORT FORM

(55)

Brief Pain Inventory (Short Form)

1. Throughout our lives, most of us have had pain from time to time (such as minor headaches, sprains, and toothaches). Have you had pain other than these everyday kinds of pain today?

Yes No

2. On the diagram, shade in the areas where you feel pain. Put an X on the area that hurts the most.

3. Please rate your pain by marking the box beside the number that best describes your pain at its **worst** in the last 24 hours.

0 1 2 3 4 5 6 7 8 9 10
No Pain Pain As Bad As You Can Imagine

4. Please rate your pain by marking the box beside the number that best describes your pain at its **least** in the last 24 hours.

0 1 2 3 4 5 6 7 8 9 10
No Pain Pain As Bad As You Can Imagine

5. Please rate your pain by marking the box beside the number that best describes your pain on the **average**.

0 1 2 3 4 5 6 7 8 9 10
No Pain Pain As Bad As You Can Imagine

6. Please rate your pain by marking the box beside the number that tells how much pain you have **right now**.

0 1 2 3 4 5 6 7 8 9 10
No Pain Pain As Bad As You Can Imagine

BPI LONG FORM

BPI long form is used as a baseline measure in clinical trials but the short form has become the standard for use in clinical and research applications.(56)

Date:	__/__/__										
Name:	_____	_____	_____								
	Last	First	Middle Initial								
Phone:	() _____	Sex:	<input type="checkbox"/> Female <input type="checkbox"/> Male								
Date of Birth:	__/__/__										
1) Marital Status (at present)											
1. <input type="checkbox"/> Single											
2. <input type="checkbox"/> Married											
3. <input type="checkbox"/> Widowed											
4. <input type="checkbox"/> Separated/Divorced											
2) Education (Circle only the highest grade or degree completed)											
Grade	0	1	2	3	4	5	6	7	8	9	
	10	11	12	13	14	15	16	M.A./M.S.			
Professional degree (please specify) _____											
3) Current occupation _____											
(specify titles, if you are not working, tell us your previous occupation)											
4) Spouse's occupation _____											
5) Which of the following best describes your current job status?											
1. <input type="checkbox"/> Employed outside the home, full-time											
2. <input type="checkbox"/> Employed outside the home, part-time											
3. <input type="checkbox"/> Homemaker											
4. <input type="checkbox"/> Retired											
5. <input type="checkbox"/> Unemployed											
6. <input type="checkbox"/> Other											
6) How long has it been since you first learned your diagnosis? _____ months											
7) Have you ever had pain due to your present disease?											
1. <input type="checkbox"/> Yes											
2. <input type="checkbox"/> No											
3. <input type="checkbox"/> Uncertain											

8) When you first received your diagnosis, was pain one of your symptoms?

1. Yes 2. No 3. Uncertain

9) Have you had surgery in the past month? 1. Yes 2. No

If YES, what kind? _____

10) Throughout our lives, most of us have had pain from time to time (such as minor headaches, sprains, toothaches). Have you had pain other than these everyday kinds of pain during the last week?

1. Yes 2. No

10a) Did you take pain medications in the last 7 days?

1. Yes 2. No

10b) I feel I have some form of pain now that requires medication each and every day.

1. Yes 2. No

IF YOUR ANSWERS TO 10, 10a, AND 10b WERE **ALL NO**, PLEASE STOP HERE AND GO TO THE LAST PAGE OF THE QUESTIONNAIRE AND SIGN WHERE INDICATED ON THE BOTTOM OF THE PAGE.
IF ANY OF YOUR ANSWERS TO 10, 10a, AND 10b WERE **YES**, PLEASE CONTINUE.

11) On the diagram, shade in the areas where you feel pain. Put an X on the area that hurts the most.

12) Please rate your pain by circling the one number that best describes your pain at its **worst** in the last week.

0 1 2 3 4 5 6 7 8 9 10
No Pain Pain as bad as you can imagine

13) Please rate your pain by circling the one number that best describes your pain at its **least** in the last week.

0 1 2 3 4 5 6 7 8 9 10
No Pain Pain as bad as you can imagine

14) Please rate your pain by circling the one number that best describes your pain on the **average**.

0 1 2 3 4 5 6 7 8 9 10
No Pain Pain as bad as you can imagine

15) Please rate your pain by circling the one number that tells how much pain you have **right now**.

0 1 2 3 4 5 6 7 8 9 10
No Pain Pain as bad as you can imagine

16) What kinds of things make your pain feel better (for example, heat, medicine, rest)?

17) What kinds of things make your pain worse (for example, walking, standing, lifting)?

18) What treatments or medications are you receiving for pain?

19) In the last week, how much relief have pain treatments or medications provided? Please circle the one percentage that most shows how much relief you have received.

0% 10% 20% 30% 40% 50% 60% 70% 80% 90% 100%
No Relief Complete Relief

20) If you take pain medication, how many hours does it take before the pain returns?

- | | |
|---|---|
| 1. <input type="checkbox"/> Pain medication doesn't help at all | 5. <input type="checkbox"/> Four hours |
| 2. <input type="checkbox"/> One hour | 6. <input type="checkbox"/> Five to twelve hours |
| 3. <input type="checkbox"/> Two hours | 7. <input type="checkbox"/> More than twelve hours |
| 4. <input type="checkbox"/> Three hours | 8. <input type="checkbox"/> I do not take pain medication |

21) Check the appropriate answer for each item.
I believe my pain is due to:

- | | | |
|------------------------------|-----------------------------|--|
| <input type="checkbox"/> Yes | <input type="checkbox"/> No | 1. The effects of treatment (for example, medication, surgery, radiation, prosthetic device). |
| <input type="checkbox"/> Yes | <input type="checkbox"/> No | 2. My primary disease (meaning the disease currently being treated and evaluated). |
| <input type="checkbox"/> Yes | <input type="checkbox"/> No | 3. A medical condition unrelated to my primary disease (for example, arthritis).
Please describe condition: _____ |

22) For each of the following words, check Yes or No if that adjective applies to your pain.

- | | | |
|-------------|------------------------------|-----------------------------|
| Aching | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Throbbing | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Shooting | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Stabbing | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Gnawing | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Sharp | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Tender | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Burning | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Exhausting | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Tiring | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Penetrating | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Nagging | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Numb | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Miserable | <input type="checkbox"/> Yes | <input type="checkbox"/> No |
| Unbearable | <input type="checkbox"/> Yes | <input type="checkbox"/> No |

23) Circle the one number that describes how, during the past week, **pain** has interfered with your:

A. General Activity

0 1 2 3 4 5 6 7 8 9 10
Does not interfere Completely interferes

B. Mood

0 1 2 3 4 5 6 7 8 9 10
Does not interfere Completely interferes

C. Walking Ability

0 1 2 3 4 5 6 7 8 9 10
Does not interfere Completely interferes

D. Normal Work (includes both work outside the home and housework)

0 1 2 3 4 5 6 7 8 9 10
Does not interfere Completely interferes

E. Relations with other people

0 1 2 3 4 5 6 7 8 9 10
Does not interfere Completely interferes

F. Sleep

0 1 2 3 4 5 6 7 8 9 10
Does not interfere Completely interferes

G. Enjoyment of life

0 1 2 3 4 5 6 7 8 9 10
Does not interfere Completely interferes

24) I prefer to take my pain medicine:

1. On a regular basis
2. Only when necessary
3. Do not take pain medicine

25) I take my pain medicine (in a 24 hour period):

1. Not every day 4. 5 to 6 times per day
2. 1 to 2 times per day 5. More than 6 times per day
3. 3 to 4 times per day

26) Do you feel you need a stronger type of pain medication?

1. Yes 2. No 3. Uncertain

27) Do you feel you need to take more of the pain medication than your doctor has prescribed?

1. Yes 2. No 3. Uncertain

28) Are you concerned that you use too much pain medication?

1. Yes 2. No 3. Uncertain

If Yes, why? _____

29) Are you having problems with side effects from your pain medication?

1. Yes 2. No

Which side effects? _____

30) Do you feel you need to receive further information about your pain medication?

1. Yes 2. No

31) Other methods I use to relieve my pain include: (Please check all that apply)

- Warm compresses Cold compresses Relaxation techniques
Distraction Biofeedback Hypnosis
Other Please specify _____

32) Medications not prescribed by my doctor that I take for pain are:

Fig. 1. The short-form McGill Pain Questionnaire (SF-MPQ). Descriptors 1-11 represent the sensory dimension of pain experience and 12-15 represent the affective dimension. Each descriptor is ranked on an intensity scale of 0 = none, 1 = mild, 2 = moderate, 3 = severe. The Present Pain Intensity (PPI) of the standard long-form McGill Pain Questionnaire (LF-MPQ) and the visual analogue (VAS) are also included to provide overall intensity scores.

SFMPQ2
(57)

Short-Form McGill Pain Questionnaire-2 (SF-MPQ-2)

This questionnaire provides you with a list of words that describe some of the different qualities of pain and related symptoms. Please put an **X** through the numbers that best describe the intensity of each of the pain and related symptoms you felt during the past week. Use 0 if the word does not describe your pain or related symptoms.

1. Throbbing pain	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
2. Shooting pain	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
3. Stabbing pain	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
4. Sharp pain	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
5. Cramping pain	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
6. Gnawing pain	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
7. Hot-burning pain	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
8. Aching pain	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
9. Heavy pain	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
10. Tender	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
11. Splitting pain	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
12. Tiring-exhausting	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
13. Sickening	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
14. Fearful	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
15. Punishing-cruel	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
16. Electric-shock pain	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
17. Cold-freezing pain	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
18. Piercing	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
19. Pain caused by light touch	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
20. Itching	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
21. Tingling or 'pins and needles'	none	0	1	2	3	4	5	6	7	8	9	10	worst possible
22. Numbness	none	0	1	2	3	4	5	6	7	8	9	10	worst possible

PAIN DRAWING

(46) (48)

Table 1. Quantified Pain Drawing: Penalty Point Scores

- A. "Nonspecific" subgroups related to poor anatomic localization and widespread extent
1. Unreal drawings (poor anatomic localization, scores 2 points for each subheading unless indicated)
 - 1.1 Total leg pain
 - 1.2 Lateral whole leg pain (trochanteric area and lateral thigh allowed)
 - 1.3 Circumferential thigh pain
 - 1.4 Bilateral anterior tibial area pain (unilateral allowed)
 - 1.5 Circumferential foot pain (scores 1)
 - 1.6 Bilateral foot pain (scores 1)
 - 1.7 Use of five different modalities suggested in instructions (scores 1)
 2. "Look how bad I am" (scores 1 or 2 points depending on extent)
 - 2.1 Additional painful areas in the trunk, head, neck, or upper extremities are drawn in
 - 2.2 Tendency toward "total body pain"
 3. "Expansion" or "magnification" (scores 1 point for each subheading unless indicated)
 - 3.1 Back pain radiating to iliac crest, groin, or anterior perineum (coccygeal pain allowed)
 - 3.2 Anterior knee pain
 - 3.3 Anterior ankle pain
 - 3.4 Pain drawing outside the outline as an indication of magnification (scores 1 or 2 points depending on extent)
- B. "Specific" subgroup showing "additional emphasis"⁴⁵
4. "I particularly hurt here" (each subheading scores 1)
 - 4.1 Add explanatory notes
 - 4.2 Circle painful areas
 - 4.3 Draw lines to demarcate painful areas
 - 4.4 Use arrows
 - 4.5 Excessive detail in demonstrating pain areas (using suggested symbols)

Modified after Ransford.^{7D}

The described sensations
 - Use the appropriate symbols
 - Include all affected areas

Date of birth
 Name

Date:

	Dull, aching		Burning		Numbness
	Stabbing		Pins and needles		Muscular cramp

Figure 2. Pain drawing features with contributions from all four subgroups of the penalty point system (refer to Table 2). Penalty point score = 18, the sum of the value of each subgroup (6 + 3 + 5 + 4). The corresponding area raw extent assessment score = 95 (see Figure 1).

Fig. 1. Scoring template for pain drawing.

VISUAL ANALOG SCALE

(58)

Visual Analogue Scale (VAS)

Instructions for producing a VAS Bedside card:

OPTION 1

- Double-sided print or photocopy the next 2 diagrams ensuring that the lines are exactly 10 cm in length and superimposed
- Laminate the VAS Bedside card for patient use

No pain

Worst pain
ever

10 9 8 7 6 5 4 3 2 1 0

PLEASE NOTE: For purposes of double-sided print, the numbers on this scale are reversed.

OPTION 2

- Print or photocopy the next 2 diagrams on an A4 sheet ensuring that the lines are exactly 10 cm in length
- Fold at the dotted line
- Do not show the patient the numbered scale

No pain

Worst pain
ever

0 1 2 3 4 5 6 7 8 9 10

APPENDIX 4: BPI INCLUDED ARTICLES AND THEIR VALIDITIES

Articles	Convergent validity	Discriminant validity	Construct validity	Face validity	Responsiveness
BPI score identifying and discriminating neuropathic and nociceptive pain .	For neuropathic pain: Se 79,4% Sp 46,9% AUC =0,69	Wilcoxon, 2 groups of patients	Factor analysis: 3 factors (<i>Pain intensity for one and pain interference item for two</i>) explained 68,6% of the total variance. 70,68% for nociceptive group 66,48% for neuropathic group		
Reliability and validity of the BPI in individuals with chronic obstructive pulmonary disease .	Spearman = 0.79 between BPI total score and SF-MPQ total score	=convergent	Factor analysis : 2 factors explained 77% of the variance. 66,9 % for intensity 10,4 % for interference		
Validity and reliability of a <i>Turkish</i> brief pain inventory short form when used to evaluate musculoskeletal pain .	Spearman=0,21-0,35 between Turkish BPI and VAS : High correlation P<0.005		Factor analysis : 2 factors explained 56.4% of the total variance. 9,2% for intensity 47,2% for interferences		
Validation of the short form of the BPI in <i>Spanish</i> patients with non-cancer related pain .	Spearman between BPI and VAS were moderate to high : BPI severity : 0.472 BPI interference: 0,511	=convergent			High level of responsiveness : effect size increases at 3 months
Psychometric evaluation of the Arabic BPI in a sample of Lebanese cancer patient .	Pearson r = 0,63 p<0,01 between VAS and Arabic BPI		Factor analysis: 2 factors explained 67% of the variance: 11,3% for intensity 55,8% for interferences		
Validation of the <i>Turkish</i> version of the Brief Pain Inventory in surgery patients .			Factor analysis: two factors explained 72,02% of the variance 13,4% for intensity 58,6% for interferences		

Articles	Convergent validity	Discriminant validity	Construct validity	Face validity	Responsiveness
Validation of the <i>thai</i> version of the BPI in cancer patient .			Factor analysis: two factors explained 65% of the variance		
Reliability and validity of a modified BPI short form in patient with osteoarthritis .	Convergent validity with VAS : at or above 0.60 for study one (hip) and 0.41 for study 2 (knee)		Factor analysis: three factor accounted of 86% (study 1 hip) and 84% (study 2 knee) of the scale's variance: -pain intensity -pain interference on activity -impact of pain on mood		
Validating the Brief Pain Inventory for use with surgical patients with cancer .	Pearson: 0,51-0,83 p<0,01 between VAS and BPI pain items in the two groups (medical and surgical) except for average pain, significantly correlated with VAS for medical but not for surgical patients Pearson: 0,60-0,71 p<0,01 between VAS and BPI pain interference similar in the two groups except for walking (higher for surgical patients)				
The assessment of Cancer pain in <i>North India</i> : the validation of the <i>hindi</i> Brief Pain Inventory.			Factor structure is similar between Hindi and English version. Factor one and factor two are interference and severity subscales.		
A Brief Cancer pain assessment Tool in Japanese : The Utility of the Japanese Brief Pain Inventory.			Factor analysis: two factor solution Pain intensity Pain interference		
Analysis of Pain and Interference Patterns With Brief Pain inventory in Patients With Bones Metastases : A Confirmatory Study.		=construct	CFA : comparison between two (pain and interferences subscales) and three (pain, activity and affect subscales) factors models: correlation in the two factor model between: pain and interference = 0,77. correlation in the three factor model between: pain and activity = 0,75, pain and affect = 0,76. activity and affect = 0,92 sleepd does not correlate well with the other items		

Articles	Convergent validity	Discriminant validity	Construct validity	Face validity	Responsiveness
Using Confirmatory Factor Analysis to Evaluate Construct Validity of the Brief Pain Inventory.			model 2 > model 1: RMSEA (>0,08) = 0,081 and 0,165. CFI (>0,90) = 0,941 and 0,750. model 3 > model 2: RMSEA = 0,075 and CFI = 0,953 for model 3. model 3 = the best fit. The three factor solutions are invariant across disease type age and ethnicity groups.		
Development of and psychometric testing for the Brief Pain Inventory-Facial in patients with facial pain syndromes .			Three factors were identified with an eigenvalue (variance of factor) > 1.0. Three factors accounted for 97.6% of the variance. Kaiser criterion confirmed the retention of 3 factors as well.		
Validation of a modified version of the Brief pain Inventory for painful diabetic peripheral neuropathy .		=convergent and not reliable	Factor analysis: two factors explain 77.6% of the total variance.		
Development of the Wisconsin Brief pain questionnaire to assess pain in cancer and other diseases			Significant correlation between the worst pain and pain's interference with daily life Worst pain is moderately correlated with interference in each of the 6 areas (mood, social relationships, walking, sleep, work, enjoyment of life). Ratings of usual pain are significantly correlated only with interference with sleep (r=0,277 p<0,005)		
Comparison of pain measures in surgical patients			Pearson correlation = 0,33 to 0,76 p<0,001 (between BPI, VAS-R, VAS-M and SFMPQ) correlations between subscales of the BPI SF (intensity, physical emotion sensory affective) and the SF MPQ (sensory, affective) 0,33 to 0,63 for present pain and 0,37 to 0,66 for pain over 24h Pearson = modest but statically significant

ROIGNAN (Sophie) - Validity of four pain scales which have been proven reliable by a previous systematic review: *Brief pain Inventory, Short-Form McGill Pain Questionnaire, Pain drawing, Visual Analog Pain Scale*; a systematic review.

Th. : Méd. : Brest 2019

ABSTRACT:

Background: Pain is a multidimensional phenomenon that is subjective with physiological and psychological components. It is necessary to have valid and reliable pain measures. A previous study has identified Brief Pain Inventory (BPI), SF MPQ-1 and 2 (Short Form McGill Pain Questionnaire) as reliable. Visual Analog Pain Scale (VAS) and Pain drawing were less reliable but they are commonly used. The present study aimed to collect validity data of these four scales.

Method: A Medline review via PubMed was carried out with no restriction on the publication date. Only English language papers were examined. Inclusion was conducted until June 2019. Data of validity (convergent, discriminant, construct, face and responsiveness) were extracted for each four scales.

Results: 17 relevant articles were included for BPI, 8 for SF-MPQ-1, 5 for SF-MPQ-2, none for Pain drawing and 2 for VAS. Convergent validity was studied in several articles included for each scale. Construct validity was studied only for BPI and SF-MPQ. Discriminant validity was studied only for BPI in one article. Face validity was studied in one article for both SF-MPQ-1 and 2. Responsiveness was studied in one article for BPI, 2 articles for SF-MPQ-1 and 3 articles for SF-MPQ-2.

Satisfactory validity data were found for BPI and SF-MPQ. Data were inadequate for Pain drawing and insufficient for VAS.

Discussion: The five relevant validities were not all studied for BPI and SF-MPQ. Further studies could supplement these data. It will be necessary to study external validity of VAS, which is very useful in practice.
